

N-STIGATE™

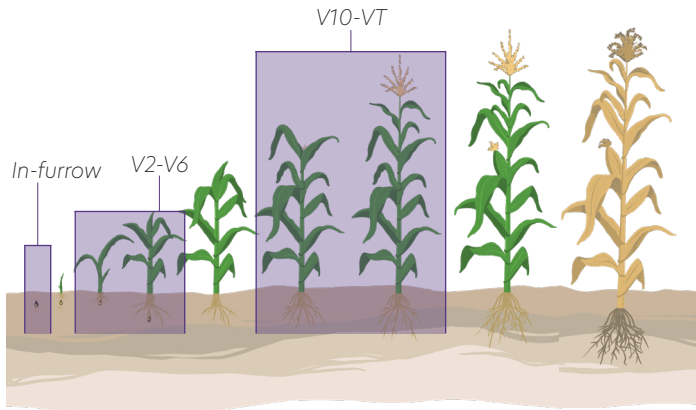

N-Stigate contains 16 bacterial strains to **maximize fertilizer and soil nutrient value**. It is designed to capture nutrients from the soil, air(N), decaying crop residue, and fertilizer and convert them to available forms for the crop to utilize despite soil variability.

Application Method:

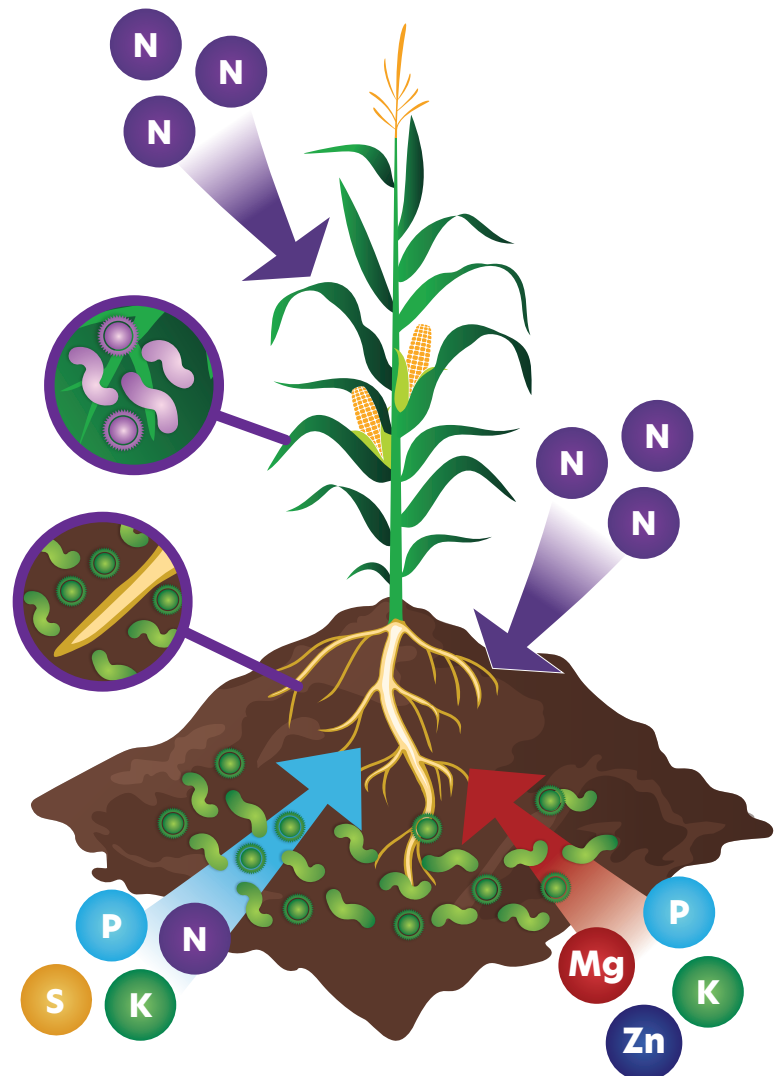

Use Rate: 4 oz/A

Why N-Stigate?

- Releases more nutrients from soil, fertilizer, residue, and even the air (N) to keep plants fed all season.
- Enhances nutrient availability (N, P, K, S + micros) by boosting microbial diversity, mineralization, and uptake.
- Delivers resilient, high-CFU microbes that colonize quickly in the soil and rhizosphere for consistent performance.
- Maximizes yield potential by continuously converting unavailable nutrients into crop-ready forms through harvest.
